Clinical responsibility and intended use

Version 1.0 | Prepared 23 September 2026

Purpose

This statement explains the clinical roles described in Healthbotics' professional workflow. It is an informational statement, not a clinical validation report or a replacement for a service agreement.

The professional workflow

Patient symptom information is provided to the professional platform. Healthbotics analyses that information and produces AI-generated triage results for healthcare professionals to review.

The clinician's role

The doctor reviews the results alongside the patient's information and their own clinical judgement to determine the appropriate next step. An AI-generated output is not a confirmed diagnosis. It may be incomplete or incorrect and should not replace clinical assessment.

Intended use and limitations

The professional product supports clinician-reviewed decisions. It is not an emergency service. The demonstration screens on the public website illustrate the workflow; they are not clinical advice for an individual patient.

No claim is made in this statement that the platform has demonstrated reductions in waiting times, diagnostic errors or hospital demand. Such outcomes require evaluation in the intended setting. External AI publications are background research, not independent validation of Healthbotics.

Separate patient platform

The patient platform is a separate service in which patients answer symptom questions directly. Users should review its applicable intended-use, access and privacy information. The professional workflow described here should not be assumed to describe every feature or responsibility in the patient service.

Questions

For questions about the professional workflow or product scope, contact Support@healthbotics.ai. Please do not include patient-identifiable information in a general enquiry.
